Historical forecast age is a confounder of the covariance proxy
Older TLEs have longer propagation horizons
Three-mode coefficient norm
Historical propagation age at scan midpoint (h)
Nominal propagation age (h)
Within each target context
log(1 + coefficient norm) minus context mean
Historical age minus context mean (h)
Capping and extra historical propagation age
Largest covariance eigenvalue before clipping
41 uncapped
55 capped at 16
Mean historical age minus nominal age (h)
Mean standardized parameter-energy fractions
Fraction of coefficient second-moment trace
Mean motion
Inclination
