Family outcomes remain mixed and many targets lack simultaneous training support
Native-predicted RMS (Hz)
Zero-mean projected differential RMS (Hz)
Native held density gain
Held-time coverage by training families within5s
Time coverage
Each point is one conditional family/scan target. Native-time RMS reconstructs the noise-weighted affine-null vector.
Same NORAD/RF does not exclude distinct nonlinear transmitter/path errors; labels and noise were selected from earlier all-RF data.
